The SSAM is a 13-item scale that assesses the tendency to report responding to threats with affirming self-related cognitions, in particular by focussing on personal strengths and attributes, values and principles, and important social relationships. Validation evidence can be found in the above paper, which should be used whenever referencing this scale.

Scoring We recommend scoring the SSAM as follows:

SSAM = (strengths + values + relations)/3

strengths = (SSAM1 + SSAM8 + SSAM9 + SSAM13)/4

values = (SSAM 2 + SSAM3 + SSAM5 + SSAM12)/4

Sometimes when we face difficulties, challenges or problems in our daily lives we can find ourselves thinking about ourselves.

We are interested in how often you find yourself thinking about yourself when things start to bother you.

When I feel threatened or anxious by people or events I find myself ...
